

(a)

```
int y;  
for(y = 5; y < 10; y+=2)  
{  
    System.out.println(y);  
}
```

(b)

```
for(int z = 10; z > 0; z--){  
    System.out.println(z);  
}
```

/4

```
(a)
    int m = 0;
    int j = 0;

    do{
        j *= -1;
        if(j >= 0){
            m += 2;
        }
        j += 2;
    }while(m < 4);

    System.out.println(j);
```

```
(b)
int i = 5, j = 0;
do{
    for(j = 0; j < i; j++){
        System.out.print(" ");
    }
    System.out.println();
    i--;
}while(i > 0);
```

3. The Decrypt class below accepts a number from the user and then converts the number to its character representation. Each pair of numbers in the provided number represent the ascii equivalent of a character and therefore can be used to identify the corresponding symbol.

In the example below, each pair of numbers in num map to a different symbol as shown,

num	pairs					ascii equivalents of pairs				
8773846772	87	73	84	67	72	W	I	T	C	H

Write the Decrypt class below. The final string of characters should be stored in String called result,

```
public class Decrypt{

    public static void main(String args[]){

        int num = Integer.parseInt(args[0]);

    }

}
```
