Exam Set 2E
AP Computer Science A

Name _____ Period_____

1. Write code that could be used to reverse a number and store the reversed number in a variable called `reversed`. Your code should work for any number with 4 digits. Consider the int data type below,

```
int number = 1234;
```

When your code is ran, "4321" should be stored in `reversed`.

Below are more examples,

int data type	**reversed**
`int n1 = 3455;`	5543
`int n2 = 8767;`	7678
`int n3 = 2468;`	8642

```
//precondition: number = 1234;

int lastDigit = number % 10; //lastDigit = 4
int reverse = lastDigit;  //reverse = 4
int number = number/10;   //number = 123

lastDigit = number % 10;//lastDigit = 3
reverse = reverse * 10 + lastDigit; //reverse = 40 + 3 = 43
number = number/10; //number = 12

lastDigit = number % 10;//lastDigit = 2
reverse = reverse * 10 + lastDigit; //reverse = 430 + 2 = 432
number = number/10; //number = 1

lastDigit = number % 10;//lastDigit = 1
reverse = reverse * 10 + lastDigit; //reverse = 4320 + 1 = 4321
```
